Fvent

Silver has rallied through US\$40/oz and looks like heading higher. The gold/silver ratio is still elevated at 89x, and silver would need to rally to US\$52/oz to bring this ratio back to its long term average of 70x. Silver is one of our favorite commodities for 2025 for two reasons: 1) Its correlation with a strong gold price, and 2) the strong demand outlook for its application in solar panels. Boab Metals has one of the ASX's most advanced silver projects at Sorby Hills. The rally in silver has seen Boab Metals hit a 2 year high with the stock up 122% in the past year. We see further upside as the company brings Sorby Hills into production.

Highlights

- The Sorby Hills Project is located in the Kimberley Region of Western Australia. Boab released a DFS in January 2023 and updated the financials with the completion of a FEED study in June 2024. The key project metrics include upfront capital expenditure of A\$264M, average C1 cost of US\$ 0.36/lb payable Lead (including silver credits), pre-tax NPV₈ of A\$411M, pre-tax IRR of 37%, and average annual EBITDA of A\$126m. Our post tax NPV₁₀ of the project is A\$250m.
- There are limited opportunities for investors to gain exposure on the ASX. In our view, Sorby Hills is an advanced and robust project with one of the largest silver resources (53Moz).
- Gold has been driven higher by geopolitical tensions and the move from non-OECD countries to move away from the USD as the global currency standard. The gold price and silver price are historically strongly correlated, with the gold/silver ratio averaging 70x over the past 20 years. Silver has recently caught up to the surge in the gold price, but the gold/silver ratio is still a historically high 89x, and silver would need to rally to US\$52/oz to bring the ratio back to its long run average.
- Demand for silver in the production of solar panels has driven the silver market into a supply deficit. Total annual silver demand has grown from a relatively steady 1,000Mozpa over the past decade to 1,164Moz in 2024 with further growth expected. Demand for solar panels has increased from around 5% of total demand in 2015 to around 17% in 2024. Silver is the most conductive metal and has excellent reflective properties which make it ideal for solar panels.
- Sorby Hills other main commodity is lead, which is perhaps the most mis-understood of the base metals. It is a common misperception that demand for lead is falling as lead-acid batteries are replaced by lithium-ion batteries and the usage of lead in industrial applications reduces due to its toxicity. Lead consumption has actually increased by an average 3.2% per annum from 2004-2024 and we conservatively forecast further annual growth of 2% to 2030. Global lead usage is expected to increase from 11.7Mt in 2020 to 14.6Mt in 2030.
- In 2024 Boab Metals announced a binding offtake agreement with Trafigura for the leadsilver concentrate that will be produced from Sorby Hills Project. The Sorby Hills concentrate is very clean and is likely to attract a negative treatment charge due to its beneficial impact on concentrate blends. The offtake also comes with a US\$30m prepayment to cornerstone the financing plan.
- We believe Boab has a great opportunity to source part or all of its debt funding from Commonwealth Government financiers. Commonwealth lenders such as the Northern Australian Infrastructure Facility (NAIF) can provide concessional loans for the development of infrastructure projects in northern Australia.

Recommendation

We retain our BUY recommendation and A\$0.40 Price Target.

Company Description	

Boab Metals is a base metal exploration and development company, primarily focused on its flagship Sorby Hills Project in Kununurra, Western Australia. The flagship Project is the largest undeveloped, near surface lead-silverzinc deposit in Australia. Sorby Hills is 75%-owned by Boab Metals and 25% owned by Henan-Yuguang - China's largest lead smelting / silver producer.

Boab one of the cheapest silver exposures on the ASX

Although the Sorby Hills project is predominantly lead rather than silver (lead 70%, Silver 30%) – the Boab share price has been highly correlated with the silver price. With a 53Moz silver resource, Boab has one of the largest and most advanced silver projects on the ASX and is trading at just A\$0.5/oz of resource

Silver - through US\$40/oz with potentially more upside ahead

The silver price has rallied through US\$40/oz in 2025 and is up 42% year-to-date.

There are two main drivers of the increase:

- A rally in sympathy with gold. The gold price is being driven higher by geopolitical tensions and the move from non-OECD countries to move away from the USD as the global currency standard.
- The fundamentals of supply/demand for silver look very supportive for further price increases. Silver has strong demand characteristics due its demand for industrial applications in solar panels.

Since early 2021 the gold/silver ratio has increased from its long run average of ~70x to peak at over 100x earlier this year as silver lagged behind the gold price rally. The ratio has since pulled back to 89x today. For silver to revert to its long run average ratio with gold it would need to rally to \sim US\$52/oz.

Silver - growing demand from solar power

Silver is a soft and lustrous metallic element that is unique as a commodity and currency. Of all metals, it has the highest electrical and thermal conductance and optical reflectivity. Throughout history it has been used as a white metal in jewellery or coins; as with other precious metals, a protection against inflation. More recently it is being used for industrial purposes. Solar panels are now ~11-14% of total silver demand. Its extensive industrial use is somewhat regulated by silver's higher relative cost to other metals.

The photovoltaic cells used in solar panels extensively rely on silver due to its exceptional electrical conductivity and thermal properties. According to industry estimates, approximately 20 grams of silver is required per kilowatt of solar panel capacity. With the increasing installation of solar panels worldwide, the demand for silver in the solar industry has experienced substantial growth. Solar PV generation increased by a record 320 TWh (up 25%) in 2023, reaching over 1 600 TWh. It demonstrated the largest absolute generation growth of all renewable technologies in 2023.

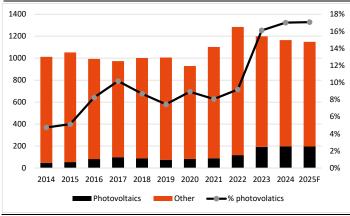

Silver's excellent light reflection properties are another significant driver of its demand in solar applications. By coating the back surface of solar cells with silver, it can effectively enhance the efficiency of the panels. Studies indicate that silver back contacts can improve the conversion efficiency of solar cells by up to 5%.

The durability and corrosion resistance of silver in solar panels have quantifiable benefits as well. The use of silver coatings ensures the longevity and reliability of solar cells, reducing maintenance costs and increasing the lifespan of panels.

In terms of affordability and cost-effectiveness, silver is an attractive option for solar panel manufacturers. The cost of silver accounts for a relatively small portion (<5%) of the total solar panel production expenses.

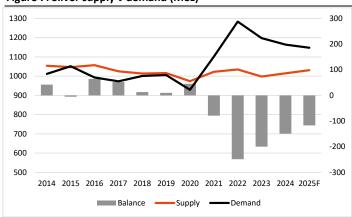

According to The Silver Institute, the silver market moved into a supply deficit in 2022 due to strong demand from net physical investment. The rise in the price has seen demand from physical investment taper off over the past two years but the market remains in deficit with the negative balance being made up by drawdowns from exchange traded products.

Lead - the original and reliable battery metal

Lead is a versatile metal that has been used for centuries due to its unique properties. It is soft, dense, and heavy, making it ideal for various applications such as batteries, construction, and radiation shielding. Approximately 80% of all lead is consumed in the production of lead-acid batteries.

Figure 9: Lead usage 2023

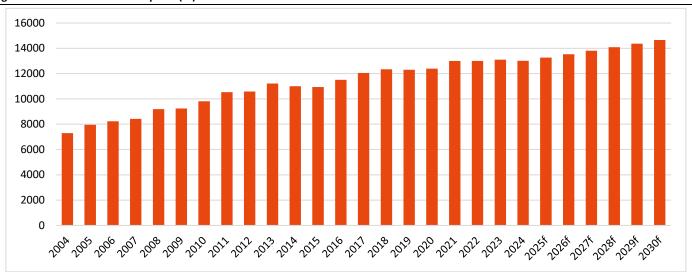

Source: ILZSG, ILA, Shaw and Partners

It is a common misperception that demand for lead is falling as lead-acid batteries are replaced by lithium-ion batteries and the usage of lead in industrial applications reduces due to its toxicity. In reality, lead consumption has increased by an average 3.2% per annum from 2004-2024 and we forecast further annual growth of 2% to 2030.

It is certainly true that lithium-ion batteries have become the dominant battery technology, but the reliability of lead-acid batteries will continue to result in demand growth for telecommunication, uninterruptable power supply (UPS) and for starter/lighting/ignition (SLI) batteries in both internal combustion and electric vehicles. Most electric vehicles include a lead-acid battery to power critical functions in the vehicle.

Figure 10: Annual Lead Consumption (kt)

Source: ILZSG, Statista, Shaw and Partners forecasts

Figure 11: Lead usage

Figure 11: Lead u	sage
Use	Description
Batteries	Lead has good electrical conductivity and resistance to corrosion. The major use for lead is in lead-acid batteries to store power in cars, wheelchairs, lift trucks, baggage loaders, even golf carts and submarines. Batteries are important in hospitals and communication centres needing a back-up supply in case of power failures and in solar and wind power systems (to store the energy). Non-nuclear submarines rely on a bank of lead-acid batteries for extra power and for ballast to keep them upright. These batteries provide as much power in five hours as the average home uses in a year.
Health	As lead is very dense and highly absorbent, it is used as a radiation shield around X-ray, radiotherapy treatment, and nuclear equipment. It is also in computer screens and TV tubes to absorb radiation.
Sound and vibration insulation	Lead's density and softness also makes it an excellent absorber of sound, so thin lead sheets are laminated onto building materials such as plywood, aluminium or steel to provide sound insulation. Even whole buildings can be mounted on lead to reduce vibration problems.
Cables	Lead's ductility and resistance to corrosion makes it an excellent sheath around electrical cables, especially under the sea.
Chemical industry	Lead's corrosion resistance makes it ideal to line containers and pipes for storing and carrying corrosive chemicals.
Housing	Lead flashings (where roofs meet walls or chimneys) stop leaks, resist wind lift and do not corrode.
Weights	Lead's density makes it useful as a weight, such as for curtains, SCUBA divers and yacht keels (fishing sinkers tend not to be made from lead these days).
Solders	Lead's low melting point makes it an excellent solder, often alloyed with tin. However, due to lead's toxicity, this usage is decreasing.
Lead oxide	In producing high-quality crystal glassware, stained-glass window 'frames', colour lenses, pottery glazes and as a 'red lead' undercoat on bridges and other exposed steel structures.
Other	Ammunition, ceramics, UV barrier in PVC products, and to minimise sulphur gas emissions by industry.

Lead-Acid Batteries

The primary use of lead is in lead-acid batteries, which are used in a wide range of applications. Lead-acid batteries account for approximately 80% of global lead consumption. These batteries are used in automobiles, trucks, boats, motorcycles, and other vehicles, as well as in backup power systems for critical infrastructure such as hospitals, data centres, and telecommunication towers.

The Consortium for Battery Innovation commissions independent market analysis of the lead battery market from Avicenne Energy. Avicenne is a market research and consulting firm who publish an annual report called "The Worldwide Rechargable Battery Market"

Avicenne is forecasting global demand for lead-acid batteries to increase from 500GWh in 2020 to 650GWh in 2030.

700 600 500 400 300 200 100 Λ 2010 2015 2020 2025 2030

Figure 12: Lead-acid battery demand (GWh)

Source: Consortium for Battery Innovation, Avicenne

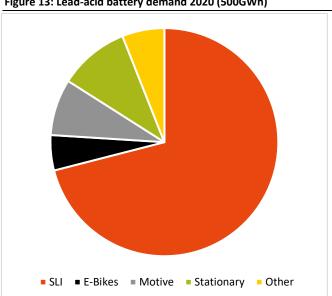

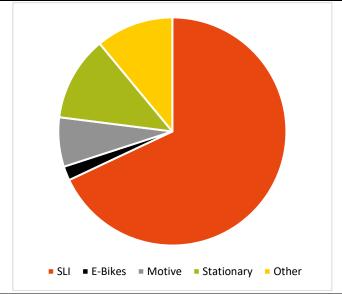

Figure 13: Lead-acid battery demand 2020 (500GWh)

Source: Consortium for Battery Innovation, Avicenne Source: Consortium for Battery Innovation, Avicenne

Avicenne separate their demand forecasts into four categories and 'other':

SLI (Starter/Lighting/Ignition). This includes the traditional SLI battery in an Internal Combustion Engine (ICE) vehicle, but also the newer start/stop batteries, and batteries used in electric vehicles which power essential and safety functions. Most electric vehicles include a lead-acid battery.

E-bikes. Avicenne is expecting E-bike demand for lead-acid-batteries to decline over the next decade, presumably because the non-critical nature of the application means that Ebike lead-acid batteries can be replaced by lithium-ion batteries.

Motive – These are lead-acid batteries used to power vehicles like forklifts. Modest demand growth of 1%pa is expected as usage is gradually replaced by lithium-ion batteries as their cost falls.

Stationary. Applications include telecommunications and uninterruptable power systems (UPS). These applications must provide back-up power in emergency situations and lead-acid batteries are preferred over lithium-ion batteries which have yet to proven over the time frames required for long term storage.

The advantages of lead-acid batteries

Current commercial 12V battery technology relies heavily on lead-based chemistries. Globally, over 400 million 12V lead-based batteries are produced every year to supply OEMs and aftermarket light-duty vehicle applications. Enhanced Flooded Batteries (EFB) and Absorbent Glass Mat (AGM) batteries provide significant improvements compared to conventional lead-based flooded batteries, in charge acceptance and cyclic durability, and have been deployed for micro-hybrid applications.

Lead-based batteries, especially EFB and AGM batteries, are extremely stable and durable in comparison to competing technologies; failure modes, and safety of lead batteries, are well understood by the battery supply chain. Lead-based batteries for SLI applications are covered by established international standards including battery testing procedures and service requirements.

For SLI applications, 12V batteries will need to continue to enable stop/start operations, support critical safety applications, and support Advanced Driver Assistance Systems and autonomy deployment. These applications require always-on' functionality and these batteries must not only meet rising power consumption demands, but also be 100% dependable. Battery health is a critical attribute.

Lithium-ion batteries being commercialised for 12V applications have high energy density, high cycle life, and high calendar life but currently have higher self-discharge rates compared to lead-based batteries. Standardisation is still in progress.

One of the advantages of lead-acid batteries is their performance in cold conditions. The low-temperature performance and durability of Lithium-ion batteries has improved significantly in the past few years; Lithium-ion battery manufacturers now report parity with lead batteries in terms of cold cranking (albeit only within standard industry limits). However, use of new electrode materials to ensure lithium batteries can meet cold cranking requirements, has resulted in a trade-offs in high-temperature performance and safety. Moreover, the charging performance of the batteries at low temperatures also requires further investigation.

A further advantage of lead-acid batteries is the ability to recycle them. Recycling processes for Lithium-ion batteries are relatively complex and immature; development is expected through 2030 but may never be as efficient as the closed loop recycling processes seen for lead. Moreover, 12v Lithium-ion batteries are typically based upon lithium iron phosphate chemistry that contains no economically valuable metals and thus have very low incentive for recycling.

Binding offtake for Sorby Hills

Boab Metals has executed a binding offtake agreement with Trafigura for the lead-silver concentrate produced from the Sorby Hills Lead-Silver-Zinc Project located in the Kimberley Region of Western Australia.

The offtake agreement is for 75% of the concentrate at LME prices. The agreement also comes with a US\$30m prepayment facility.

Trafigura is one of the world's leading commodity traders and we view this announcement as a strong endorsement of the Sorby Hills Project. The prepayment will cornerstone the financing process for the project with Boab now aiming for a Final Investment Decision in mid-2025.

We expect Boab to now re-engage with the Northern Australia Infrastructure Facility (NAIF) who may provide a significant proportion of the required debt funding.

We model the project required around A\$280m in funding (including working capital) which we assume will consist of A\$180m in debt and A\$100m in equity. Some of the equity may be provided by a strategic partner.

Figure 15: Key Offtake Terms

Seller	Sorby Hills Pty Ltd ("SHPL") (100% subsidiary of Boab)
Buyer	Trafigura Asia Trading Pte. Ltd.
Volume	If Financial Close on the Prepayment Facility is achieved, the offtake will be for 75% of lead-silver concentrate produced at Sorby Hills, (minimum 531,000 tonnes, ~7 years based on the FEED Study production schedule). If Financial Close on the Prepayment Facility is not achieved, the offtake will be for 25% (or greater, at SHPL's discretion) of lead-silver concentrate produced at Sorby Hills (minimum 177,000 tonnes) provided that if Boab exercises its option to terminate the Prepayment Term Sheet or obtains alternative financing for development and construction of the Project, the offtake will be for 50% (or greater, at SHPL's discretion) of lead-silver concentrate produced at Sorby Hills (minimum 354,000 tonnes).
Metal Pricing	For Lead: LME Cash Settlement price averaged over the relevant quotational period. For Silver: the official LBMA Silver price averaged over the relevant quotational period.
Payables	Typical payabilities for Lead and Silver
Treatment Charge	Benchmark linked Lead Treatment Charge reverting to a simple average of the Benchmark and Spot Lead Treatment Charge if Financial Close is not achieved on the Prepayment Facility

Source: BML ASX release 10 Dec 2024

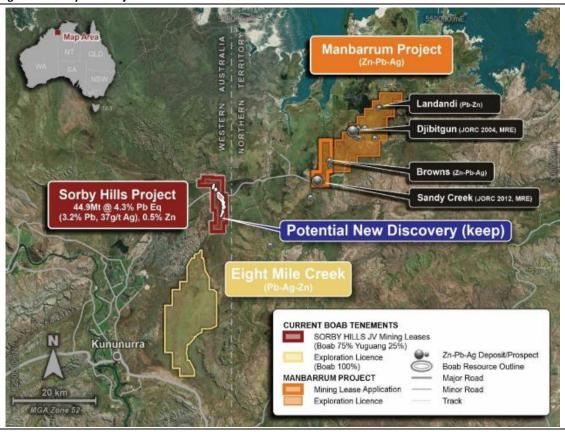

Figure 16: Key Prepayment Facility Terms

Seller	SHPL
Guarantor	Boab
Buyer	Trafigura Asia Trading Pte. Ltd.
Facility Limit	US\$ 30 million
Term	5 years from first drawdown
Interest Rate	3-month Term SOFR ¹ + 5% p.a.
Grace Period	18 months interest only period (option to capitalise interest)
Repayment	42 monthly instalments following the Grace Period
Security	1st ranking security over SHPL's assets and 1st ranking security over the Company's shareholding in SHPL
Financial Close	To be achieved within 18 months of execution of the Prepayment Term Sheet, unless mutually extended, and subject to conditions precedent to financial close and drawdown.

Source: Boab FEED study June 2024

Boab will move to 100% of Sorby Hills

In 2024 Boab Metals executed an option agreement with joint venture partner Henan Yuguang Gold & Lead Co. Ltd ("Yuguang") to acquire their 25% interest in the Sorby Hills Lead-Silver-Zinc Project located in the Kimberley Region of Western Australia.

The ability to exercise the option is subject to Boab reaching a Final Investment Decision (FID) on the Sorby Hills Project within the next 12 months. Should the option be exercised, Boab will pay Yuguang:

- Tranche 1: A\$12.5m upon exercise of the option and the concurrent acquisition of Yuguang's 25% Joint Venture interest;
- Tranche 2: A\$5.5M payable no later than 12mths from the commencement of concentrate production at Sorby Hills; and
- Tranche 3: A\$5.0M payable no later than 18mths from the commencement of concentrate production at Sorby Hills.

In our view, this is an excellent outcome for Boab Metals and paves the way for a Final Investment Decision in coming months.

Acquisition of the Degrussa processing plant

On 30 April 2025, Boab executed a binding sale & purchase agreement with Sandfire Resources to acquire the Degrussa processing plant for use at Sorby Hills. The acquisition price of A\$10m is substantially below the A\$136m capital cost estimate of a new processing plant.

The use of the Degrussa plant has the potential to significantly reduce the capital cost of the processing plant and may reduce the funding requirements for the project from A\$280m to around A\$250m. That is not included in our forecasts.

Key risks

- The prices of silver and lead are volatile and difficult to forecast. The actual prices may differ substantially from our forecasts.
- The Sorby Hills project is not yet producing and there is a risk that Boab is unable to bring the operation in to production. The project may cost more than expected to build and may not operate as expected.
- Boab requires around \$280m of new capital to finance the Sorby Hills Project. There is a risk that capital markets are not willing to fund the project.
- Forecasting future operating costs has considerable uncertainty. Our forecasts may
 prove to be too optimistic. If Boab's costs are higher than we expect then our cash flow
 forecasts will be too high.
- Smaller companies carry more significant 'key personnel' risk than larger organisations.
 If senior management depart the company, then it could delay projects or exacerbate operational risks.

Core drivers and catalyst

- In January 2023, Boab released the results of a Sorby Hills Definitive Feasibility Study (DFS). The DFS outlined a A\$245m project processing 2.25Mtpa of ore and producing 103ktpa of a lead/silver concentrate over a 10 year mine life. The annual production of contained metals is expected to be ~67ktpa of lead and 2.2Mozpa of silver. The DFS was updated in a FEED study in June 2024 with capex increasing from A\$245m to A\$264m.
- The DFS resulted in an estimated pre-tax NPV of A\$370M (at an 8% discount rate), an IRR of 35%, and an average annualised EBITDA of A\$119m.
- Boab is now progressing the offtake agreements and debt financing and we expect a Final Investment Decision in the next 12 months. There will be a 12-18-month construction period and first production in FY27.
- The Sorby Hills Measured and Indicated Resources is 23.6Mt at 4.6% Pb Eq (3.5% Pb, 39g/t Ag) and 0.4% Zn containing 0.8Mt Pb, 0.1kt Zn and 30Moz Ag. The resource is likely to increase as further drilling and regional exploration is completed
- We model a further A\$280m of capital requirements to fund pre-production capex, working capital and ongoing exploration. We expect BML to split the funding roughly A\$100m with equity and A\$180m in debt and prepayments.

Rating Classification

Buy	Expected to outperform the overall market
Hold	Expected to perform in line with the overall market
Sell	Expected to underperform the overall market
Not Rated	Shaw has issued a factual note on the company but does not have a recommendation

Risk Rating

High	Higher risk than the overall market – investors should be aware this stock may be speculative					
Medium	Risk broadly in line with the overall market					
Low	Lower risk than the overall market					

RISK STATEMENT: Where a company is designated as 'High' risk, this means that the analyst has determined that the risk profile for this company is significantly higher than for the market as a whole, and so may not suit all investors. Clients should make an assessment as to whether this stock and its potential price volatility is compatible with their financial objectives. Clients should discuss this stock with their Shaw adviser before making any investment decision.
